CONNECTDESK · MICROMART · 6 OCTOBER 2026

Fintech on the Collection Tracker

Why the Fintech cases pulled on 4 October do not appear in CallBox, and the four-line change that puts every Fintech case on the tracker automatically, under Micromart's own rules, every five minutes.

Status
Written and checked offline. Not yet run.

FINTECH ROWS ON THE TRACKER	SHOWN IN CALLBOX TODAY	WOULD SHOW AFTER THE FEED	MICROMART'S RUN
1,690	**0**	**164**	**5 min**
every one at Amounttopay 0	lists need Amounttopay > 100	about KES 0.73M to collect	all day; new cases at 00:03

1 The check: branches, categories, agents

WHAT	WHAT THE LIVE DATA SHOWS	VERDICT
Branch	All 1,690 Fintech borrowers sit in unit 129, *Main Office*. That is 3005's only branch, by design (fintech-migration script 03). CallBox only *displays* the branch. No list filters or assigns by it. Main-book cases carry real branches (Kisii, Eldoret, Kitale…), so "Main Office" on a case identifies it as Fintech.	fine
Loan category	Micromart's 01:30 run (`CollectionTrackerBoooksMigration`) sorts each row into a band from its amounts. A row with no amount keeps its last band. In Micromart's system, **Prepayment means an instalment falls due in one or two days.** The bridge filed every not-yet-due loan there. Loan 455000, for example, paid its 6 Oct instalment early. Its next one is 13 Oct, so under Micromart's rules it enters Prepayment on 11 Oct and Due on 13 Oct.	fixed by the feed
Agents	Assigned evenly from each category's agent list (`LoanCategories.Agents`). The 273 Prepayment rows went 70 / 70 / 69 / 64 across its four listed agents. The bridge's own allocation was overridden overnight, and Fintech rows already pass through this step correctly.	works
Amounts	Zero on every Fintech row. Every list an agent works (Prepayment, Due, Watch 1–3, NPL) requires `Amounttopay > 100`. **This is the only reason the cases are invisible.**	the blocker
Login entity	All 32 CollectBox logins (4 supervisors, 28 agents) are stamped 3002. The band lists and the RNR, Negotiation, Hung up, PTP, Callback and Other lists ignore that stamp. Two places use it. *Not reachable* uses it, so a Fintech case marked "not reachable" would vanish. The *overall dashboard* uses it, so its figures would exclude Fintech.	optional (17)
The 4 Oct pull	188 rows written at 19:41. The 18 failures were all **Due**: the insert named `AmountDue` twice (SQL error 264). That bug is fixed in ConnectDesk.	fixed

2 Why a pull from ConnectDesk can never stick

The amounts on the tracker are written by one Micromart procedure, `sp_GeneralCollectionTrackerbooks`. It calls six generators (Prepayment 2 days, Prepayment 1 day, Watch 1, Watch 2, Watch 3, Due) and passes them **3002**. Three of the six also hardcode 3002 inside. Then it applies two post-steps. First, a loan 90 days past maturity becomes NPL at its full balance. Second, it sets `Amounttopay`.

Each generator opens with a reset that is **not limited to an entity**, for example `UPDATE CollectionTracker SET Watch1 = 0 WHERE Watch1 > 0`, applied to every row. The procedure runs about every five minutes, all day. The evidence, read at 03:49:

- all 41,026 main-book loans 90 days past maturity hold an NPL amount equal to their *live* balance;
- the last touch was 8 seconds before the reading;
- all 61 NPL loans paid in the previous 30 hours already show the new balance.

Anything written into a Fintech row from outside is therefore zeroed within five minutes, and refilled only for 3002.

> **Never call Micromart's generators a second time with 3005**
>
> The second call's reset zeroes everything the 3002 call just wrote, and the main book's floor goes blank. That is why the fix runs *inside* their procedure instead of beside it.

3 The fix: feed 3005 inside Micromart's own run

WHEN	STEP	OWNER
Every 5 minutes	Six generators fill the 3002 amounts (after resetting every row)	Micromart, unchanged
Same run, next	**Fintech feed**: the same six windows for 3005, with their arithmetic	**New:** `sp_MicroEazy_Feed…`
Same run, last	Post-steps: NPL by maturity, then `Amounttopay`. These now cover Fintech too.	Micromart, unchanged
Daily, 01:30	Sort every row into a band, then hand cases to the agents listed for that band	Micromart, unchanged
Always	CallBox lists and ConnectDesk read the same rows	both systems

The only change to Micromart's code is four lines inside `sp_GeneralCollectionTrackerbooks`, between its last generator and its post-steps.

So a Fintech loan enters, ages, changes band and leaves the tracker exactly as a main-book loan does:

- the same thresholds (more than KES 100 for Prepayment and Watch 1–2, none for Watch 3);
- the same NPL rule (more than 90 days past maturity);
- the same agent lists and the same commission bands.

The hook is wrapped so a Fintech failure is logged and never stops the main book's post-steps. The feed times itself out after 15 seconds rather than hold up their run.

One deliberate difference from their code: the Due window is grouped per loan. Theirs is not. A loan with two instalments due the same day would make their MERGE fail (error 8672) and empty the whole Due window.

The 1,672 open 3005 loans with no schedule rows are the migration stubs, with nothing to collect. They stay out, exactly as they should.

4 How to run it

In SSMS against `Serviceconnect`, one section at a time, reading the messages pane in between. Every section is safe to re-run.

STEP	DOES	LOOK FOR
16.0	Preflight, read-only: the SQL Agent job and schedule, the anchor line, today's Fintech rows	The job step calls `sp_GeneralCollectionTrackerbooks`. `anchorLines = 1`. If the job calls the six generators directly instead, **stop and send the output**.
16.1–16.2	Adds a run log, a backup table and the feed procedure. Additive.	"Created ..." messages, no errors
16.3	Dry run. Nothing is written.	By band: about 20 Prepayment, 9 Due, 74 Watch 1, 34 Watch 2, 27 Watch 1 Matured (6 Oct figures; they move daily)
16.4	The hook. Run with `@Install = 0` first: it prints the procedure as it would read. Then set it to 1.	"Hook installed". Their original text goes to the backup table in the same transaction.
16.6	Verify, 5–10 minutes later	A `hook` row every few minutes with no error, and Fintech cases with amounts per band
16.5	Optional: feed and sort now	Today's cases on CallBox this morning. New rows still get their agent at 01:30.
17	Optional, Micromart's call: *Not reachable* and the overall dashboard include 3005 for Micromart logins	Off by default. `@Apply = 0` reports; 1 applies.

Undo: `16-17-ROLLBACK-collectbox-feed.sql` removes exactly what was inserted, from the *current* text, so any later edit Micromart make to those procedures survives. Their next run then zeroes the Fintech amounts, which is the state of 6 Oct. Tracker rows are never deleted: call logs and promises point at them.

5 Decide before switching it on

- **Commission starts flowing.** Micromart's repayment trigger calls `PtpKnocker` on every payment. Once a Fintech case carries an amount, its payments credit the assigned agent in `PayedAmount`: Watch 1 at 0.25%, Watch 2 at 1.2%, Watch 3 and NPL at 10%, Prepayment and Due at 0. Today they credit nobody.
- **Same agents as the main book.** Fintech cases join each band's existing agent list. A dedicated Fintech team would need a change to Micromart's assigner. It runs inside their SQL Agent job, which our login cannot read.

- **Load.** The feed reads `loanSchedule` (a 2-million-row table with no index) once per run. Their generators already read it six times.
- **ConnectDesk follows automatically.** The Fintech bridge page now reports the feed's real state instead of a fixed "Not connected". It refuses a manual pull once the hook is in, because the feed is the pipeline from then on. Its work queue shows every tracker row whatever the amount; CallBox shows only rows with one.

6 What was checked, and what was not

CHECK	RESULT
T-SQL syntax	**Pass.** All three scripts parse under Microsoft's own parser (ScriptDom, SQL Server 2022 grammar). Controls with deliberate errors were rejected.
The hook, replayed	**Pass.** Applied to the master's real text, it yields an ALTER that parses. It lands after the last generator and before the post-steps, and every original line survives.
The rollback, replayed	**Pass.** It restores the master byte for byte, whether the server stores the altered text as ALTER or CREATE. For 17, the predicate counts match (2 + 0 and 2 + 12) and the round trip is exact.
Live, read-only	Every figure in this document, plus the ConnectDesk status query, which today reports not installed, not hooked, 0 cases with an amount.
Not done	**Nothing has run on Micromart's server.** 16.3 is the first execution. The ConnectDesk changes were reviewed by hand but not typechecked: the typecheck was blocked in this session. They are uncommitted.

Prepared 6 October 2026 from read-only queries against Micromart's server (services, CollectBox and Serviceconnect). Scripts: fintech-migration/16-fintech-into-collectbox.sql, 17-fintech-in-callbox-lists.sql, 16-17-ROLLBACK-collectbox-feed.sql. No customer is named in this document.
